This report provides the evaluation results for the 2022 Camp HOPE America impact on children’s Hope, Resilience, and Character Development. Camp HOPE America is a program of the Alliance for HOPE International and the first camping and mentoring program in the country focused on children impacted by domestic violence and trauma. Data for this evaluation is based upon Camp HOPE America programs from Alabama, Arkansas, California, Colorado, Connecticut, Florida, Illinois, Idaho, Louisiana, Nevada, North Carolina, Ohio, Oklahoma, Tennessee, Texas, Utah, Virginia, and Wisconsin.

– In order to assess changes in hope, resilience, and character development, a matched pre-camp, post-camp, and follow-up assessment design was used.

– A total of 1041 campers provided responses to the self-report survey. Of these 1041 campers, 919 provided complete data at the pre-camp assessment, 895 provided complete data on the final day of camp assessment, and 707 provided complete data at the 30-day follow-up assessment.

– Matched comparisons were available for 627 campers across all three-assessment periods. Comparisons were made on child self-report of Hope and Resilience.

– The average age of campers was 11.48 years (SD = 2.64) with ages ranging from 6 to 18 years. Of the participating campers 51.1% identified as female.

– Camp counselors provided observational assessments on 776 campers on the first and last day of camp. Matched observational comparisons were made for Hope and Character Development in the areas of Zest, Grit, Optimism, Self-Control, Gratitude, Curiosity, and Social Intelligence.

**CAMPER SELF-ASSESSMENT RESULTS**

– An increase in Hope was statistically significant.

– An increase in believing in self, believing in others, and believing in dreams (Camp HOPE America Resilience) was statistically significant.

**CAMP COUNSELOR OBSERVATION**

– Increases in child positive character behaviors were statistically significant in the following areas:

  - Ability to create pathways and dedicate energy toward goals (Hope).
  - Excitement and energy toward goals (Zest).
  - Perseverance for goals (Grit).
  - Capacity to control thoughts, feelings, and behaviors when in conflict (Self-Control).
  - Positive future expectation (Optimism).
  - Appreciation for the kindness received by others (Gratitude).
  - Awareness of the feelings and motivations of others (Social Intelligence).
  - Desire to learn and seek out new information (Curiosity).
INTRODUCTION

CHILD EXPOSURE TO DOMESTIC VIOLENCE

Domestic violence touches and negatively impacts many individuals in the United States every year. More than ten million children and adolescents in the United States witness acts of domestic violence each year (American Academy of Child and Adolescent Psychiatry, 2019). The Centers for Disease Control and Prevention defines domestic violence or intimate partner violence as “physical violence, sexual violence, stalking, or psychological harm by a current or former partner or spouse” (Centers for Disease Control, 2018). Meta-analytic studies consistently find that children exposed to domestic violence are at a higher risk for emotional, social, and behavioral difficulties both in the short- and long-term (Evans, Davies, & DiLillo, 2008; Kitzmann, Gaylord, Holt, & Kenny, 2003; Wolfe, Crooks, Lee, McIntyre-Smith, & Jaffe, 2003). Children exposed to domestic violence experience additional stresses associated with the trauma of repeated separations, child custody battles, and isolation from extended family supports. Children exposed to domestic violence are also at a significantly higher risk for abuse and neglect (Fantuzzo & Mohr, 1999).

Researchers are still collecting new data on the impact of domestic violence on children, but studies have found that impacted children are at an increased risk for anxiety and depression, loss of interest in school and friends, social isolation, increased physical and psychological aggression, bullying or being bullied, and a propensity to perpetuate the cycle of domestic violence (Carlson, 1990; Lichter & McClosky, 2004; Litrownik, Newton, & Hunter, 2003). Adolescents in particular who witness domestic violence are at an increased risk of drug or alcohol abuse, truancy, declining grades and oppositional or rebellious behavior (American Academy of Child and Adolescent Psychiatry, 2019).

Given the prevalence of children exposed to domestic violence in the US and the negative consequences on their futures, an effective system-level intervention is needed to provide children the opportunity to develop positive coping mechanisms that will allow them to thrive in difficult environments. One such intervention, with the potential for system generational level influence, is Camp HOPE America. Recently, Hellman and Gwinn (2017) published the first evaluation of Camp HOPE America showing significant increases in Hope in a pre-test, post-test design among campers from several California Family Justice Centers and other multi-agency models operating Camp HOPE America programs.
Camp HOPE America is the first local, state, and national camping and mentoring initiative in the United States to focus on children exposed to domestic violence. The vision for Camp HOPE America is to break the generational cycle of family violence by offering healing and hope to children who have witnessed family violence.

Camp HOPE America is a program of Alliance for HOPE International. Alliance for HOPE International is the umbrella organization for all Family Justice Centers and similar multi-agency models serving victims of domestic violence and their children throughout the United States.
CAMP HOPE AMERICA PROGRAM

The Camp HOPE America program is a strengths and character-based summer camp and mentoring model that lasts for six days as an overnight experience and provides year-round follow-up activities. The program focuses on three key elements: 1) “Challenge by Choice” activities, 2) affirmation and praise for observed and developing character traits in youth, and 3) themed, small group discussion and activities focused on helping children set goals and then pursue those goals and the pathways to their goals. Challenge by Choice refers to challenging children to set daily achievement goals by pursuing activities with perceived danger or risk (e.g., canoeing, zip line, rafting, etc.) while allowing them to opt out of those activities if the challenge creates unmanageable stress or fear. Campers are positively encouraged to engage in the personal challenges presented, however no camper is coerced, negatively pressured, or unconstructively persuaded to take part in any activities. Campers are encouraged to support each other in their personal Challenge by Choice whether they determine to undertake a particular activity or not. All activities are designed to promote creative thinking, decision-making, problem-solving, teamwork and mutual support, reasoning, self-esteem, competency, self-management, group trust, organization, and goal setting. Even if campers do not participate in challenging activities, they are expected to cheer on and support their camper mates and participate in other daily camp activities, and to follow all safety and group protocols. For safety reasons, campers cannot leave the group setting or be alone at any time (the exception includes toileting or showering). When children arrive at camp, they turn in their phones or electronics to eliminate distractions and focus on relational interaction with other campers and adults. Electronic items were then returned after the conclusion of the camp.

Each Camp HOPE America Affiliate across the U.S. collaborates with a partner camp. The trained camp staff from a traditional camp not focused on children exposed to family violence supervised all recreational activities. Camp HOPE America Affiliate staff members and volunteers managed core program activities and other therapeutic components. The individualized child-centered approach utilizes a 1:3 counselor ratio. There are two counselors per each 6-person Hope Circle cabin group. Each group is assigned a partner Camp counselor and a Hope counselor. Throughout the week, each Hope Circle participates in the various camp activities together and works to build relationships within the smaller group instead of simply participating in all activities in a large group (Gwinn, 2015; Gwinn & Hellman, 2018).
All counselors and adult staff from local Camp HOPE America programs receive special training in trauma-informed, hope-centered mentoring and support strategies. Camp HOPE America refers to the training as “Hope Coach” training and provides practical strategies to encourage and support trauma-impacted youth during the camping week and after they return from camp and engage in monthly program and mentoring activities. The host partner camp staff members also receive training in trauma-informed, hope-centered work with trauma-impacted youth prior to the start of camp. Using a trauma-informed, hope-centered camper/counselor approach, Camp HOPE America focuses on providing affirmation and encouragement throughout the day, including nightly campfires where campers receive Character Trait Awards each day from the college-aged counselors. Camp HOPE America program activities are site-specific but have included river rafting, wake-boarding, tubing, high and low ropes challenge courses (age specific), horseback riding, arts and crafts, kayaking and canoeing, recreational hiking and field games, skits and camp songs, nightly campfire songs, journaling, KBAR (kick back and relax) time in the cabins/tents each day with counselors and campers, campfire group discussions each night (where children are asked the question “Where did you see hope today?”), three family-style meals each day (eating with their Hope Circle), and other relationship-oriented times.

Camp HOPE America creates a curriculum which includes a positive truth statement each day that the campers memorize. Some of the statements in the past have included: “My dreams are mine,” “Art is healing,” “I create my future,” “Tomorrow is a new day,” “I have a hope story,” “My pain can fuel my purpose,” “Where I focus, I will go.” The curriculum also includes a biographical story of a “Hope Hero” - someone who has overcome similar trauma or adversity as the children at camp. By associating a truth statement with a Hope Hero, children can internalize their own uniqueness, personal progress, need for others, future-oriented focus, and perseverance. And children can relate their experience to an adult or youth with a similar story to their own.

Camp HOPE America gained national recognition by receiving the 2022 Outstanding Youth Initiative of the Year by DomesticShelters.org for our excellence in serving youth impacted by domestic violence and was recognized by the National Summer Learning Association as a Summer Learning Champion and featured at their National Youth Leadership Institute. With all the knowledge and experience gained from the previous summer, 2022 Camp HOPE America affiliates were prepared to have one of their most important and anticipated summers ever. Camp HOPE America was represented in 18+ states across the U.S. and Affiliates were able to operate 60 sessions of camp with children benefiting from programming, care, and curriculum.
Hope theory refers to the cognitive process that individuals experience when pursuing the attainment of a future oriented goal. Research has emerged indicating Hope as a positive influence on overall health and wellbeing (Hellman & Gwinn, 2017). Snyder (2000) described hope as a cognitive-based motivational theory in which children learn to create strategies as a means to attain their desired goals. Hope theory has two fundamental cognitive processes termed “pathways” and “agency.” Pathway thought processes are the mental strategies or road maps toward goal attainment. In this process, children consider various pathways to their goals. Once viable pathways are formed, the hopeful child can conceive of potential barriers and develop strategies to overcome the barriers or choose an alternative pathway. Agency thinking refers to the willpower or mental energy the child can direct and sustain toward their goal pursuits. Hopeful children can exert mental energy to their pathways and persevere by self-regulating their thoughts, emotions and behaviors toward their desirable goal. Encouraging hope in children has positive physical, academic, and social benefits (Sheehan & Rall, 2011).

It is well-established that hope plays a role in a child’s capacity to flourish. Hopeful thinking among children (and adults) is positively associated with perceived competence and self-worth (Kwon, 2000) as well as lower rates of depression and anxiety (Ong, Edwards, & Bergeman, 2006). Children with higher hope are more optimistic about the future, have stronger problem-solving skills, and develop more life goals. Hopeful children are less likely to have behavior problems or experience psychological distress. These children also report better interpersonal relationships and higher school achievement success in the areas of attendance, grades, graduation rates, and college going rates (Pedrotti, Edwards, & Lopez, 2008). Moreover, hope has been shown to serve as a resilience factor when facing stressful life events among children (Valle, Huebner, & Suldo, 2006). Finally, hope was shown to be positively associated with emotional well-being in a six-year longitudinal study investigating hope and positive youth development (Ciarrochi, Parker, Kashdan, Heaven & Barkus, 2015).
METHODS

ASSESSMENT PROCEDURE

One thousand forty-one surveys were administered to the youth participants of Camp HOPE programs in Alabama, Arkansas, California, Colorado, Connecticut, Florida, Illinois, Idaho, Louisiana, Nevada, North Carolina, Ohio, Oklahoma, Tennessee, Texas, Utah, Virginia, and Wisconsin. A pre-camp/post-camp/30-day follow-up survey design was utilized. Children received the pre-test survey several days prior to camp. Post-test surveys were collected the last morning before departing from the camp and follow-up surveys were collected approximately 30 days after camp had ended. Individual Family Justice Centers were responsible for recruiting, selecting, consenting children and guardians, and data collection.

Completed surveys were then provided by the Camp HOPE America Affiliates to the University of Oklahoma research team who ensured the data was de-identified and then performed a detailed analysis.

SAMPLE DEMOGRAPHICS

Specific demographic variables that were collected included age and gender. The average age of the respondent was 11.48 years (SD = 2.60). Ages ranged from a low of 6 to a high of 18 years. Of the 1016 who reported their gender, 48.0% marked male and 51.1% female.

METHODS

There is ample documentation of the negative consequences associated with Adverse Childhood Experiences (ACEs) that expands across the lifespans of the individuals impacted. ACEs cause chronic toxic stress that leads to neurological and biological changes, including changes in brain architecture and function, effects on the immune and hormonal systems, and even alterations to the way DNA is read and transcribed (Harris, 2014). Left untreated, those who have experienced child maltreatment are more likely to experience poor mental health, engage in risky behaviors, and suffer physical diseases related to increased morbidity. Unmitigated ACEs have negative effects on education, employment, and economic outcomes into adulthood. Unmitigated ACEs are also associated with increased delinquency rates and criminal behaviors (Anda et al., 2007; Bellis, Lowey, Leckenby, Hughes & Harrison, 2013; Currie & Wisdom, 2010; Dube et al., 2001a; Dube et al., 2001b; Gwinn, 2015; Hillis, Andra, Felitti & Marchbanks, 2001; Lanier, Kohl, Raghavan, & Auslander, 2015; Reavis, Looman, Franco, & Rojas, 2013; Wilimansion, Thompson, Andra, Dietz & Felitti, 2002).

ACE scores were collected from 307 older campers who attended High Adventure camps. The average ACE score for the Camp HOPE America children in 2022 was 3.93 (SD = 2.67). At the national level, the average ACE score is 1.61 (Ford, et al., 2014). Comparing Camp HOPE America children to the national average shows a statistically significantly higher prevalence of ACE among the children \[t (306) = 15.249; p < .001\].

Over half of the Camp HOPE America children (50.2%) who were surveyed had an ACE score of 4 or higher. Studies available through the Center for Disease Control (2016) report significant negative consequences with an ACE score of 4 or higher. For example, with an ACE of 4+:

- 3600% more likely to become an injection drug (heroin) user (4600% at ACE of 6)
- 1200% greater likelihood of attempting suicide as an adult (2900% at ACE of 6)
- 1200% more likely to be a SA victim
- 1000% more likely to inject street drugs
- 700% more likely to become an alcoholic
- 600% more likely to have sex before age 15
- 300% more likely to contract HIV
- 300% more likely to become a domestic violence victim (woman); 150% (men)
- 300% greater likelihood of struggling with chronic depression
- 240% greater risk of hepatitis
- 240% higher risk of an STD
- 200% more likely to become smokers
- 51% of those with ACE Score of 4 will have behavioral problems in school

METHODS

EIGHTY PERCENT OF THE CAMP HOPE AMERICA CHILDREN REPORT AN ACE SCORE OF 2 OR HIGHER AND 50.2% HAVE FOUR OR MORE ADVERSE EXPERIENCES. THE AVERAGE ACE SCORE OF 3.93 IS SIGNIFICANTLY HIGHER THAN THE NATIONAL PREVALENCE RATE. TAKEN AS A WHOLE, THESE FINDINGS WARRANT ATTENTION TO THE POLYVICTIMIZATION NEEDS FOR CHILDREN EXPOSED TO DOMESTIC VIOLENCE.

MEASUREMENT: CHILD HOPE INDEX

The Children’s Hope Scale was developed to examine the extent to which children believe they can establish pathways to their goals as well as develop and maintain the willpower to follow these pathways (Snyder et al., 1997). This measure is comprised of six self-report items with a six-point Likert-type response format (1 = none of the time; 6 = all of the time). Possible scores range from a low of six to a high of 36 with higher scores reflecting higher hope. Recent research demonstrated good psychometric properties across age, gender, race, and language translation (Hellman, et al., 2018). Internal consistency reliability analyses indicated a pre-hope $\alpha = .80$, post-hope $\alpha = .83$, and follow-up-hope $\alpha = .85$.

Following the Camp HOPE America theme of believing in yourself, believing in others, and believing in your dreams, OU’s Hope Research Center team developed six additional items to assess each child’s self-reported resiliency. These individual items were also presented with a six-point Likert-type response (1 = none of the time; 6 = all of the time). The items and descriptive statistics are presented in Table 4. Internal consistency reliability analyses indicated pretest $\alpha = .83$, posttest $\alpha = .82$, and follow-up $\alpha = .84$.

METHODS

MEASUREMENT: COUNSELOR OBSERVATIONS

HOPE INDEX
Counselors were asked to complete evaluations of the children through the Children’s Hope Scale (Snyder et al., 1997) for each camper in their respective cabin groups. Items were reworded to reflect this approach. For example, the item “I think I am doing pretty well” was reworded to “I think the camper is doing pretty well.” The questionnaires included the same six-item Children’s Hope Scale reworded to fit the observational intent. Internal consistency reliability was adequate for the sample of counselors’ (pre-test α = .94; post-test α = .93).

CHILD CHARACTER STRENGTHS
Positive psychology is the scientific study of the emotions, traits, and relationships that promote the capacity to flourish and serve to buffer the negative effects of difficulties often experienced in life (Seligman & Csikszentmihalyi, 2000). This work has identified 24 strengths of character that help young people thrive and are associated with socially desired outcomes such as academic achievement, attendance, athletic achievement, goal attainment, leadership, tolerance, kindness and pro-social behaviors, to name a few (Park & Peterson, 2009). These 24 strengths have now been studied in over 190 countries with 2.6 million participants (viacharacter.org).

In order to target positive character development in youths, a validated measurement application can be used that promotes well-being, especially among those who have experienced stress associated with trauma. The character strengths targeted for this assessment have been consistently shown to serve as a buffer to stress and serve as an important indicator of personal well-being (Park & Peterson, 2009).

Following the positive psychology foundation that character leads to the capacity to live a fulfilling and meaningful life, we included an assessment of character strengths. Following the Character Counts model, we assessed the child in the area of Zest, Grit, Optimism, Self-Control, Gratitude, Social Intelligence, and Curiosity. Counselors rated each camper in their group at the beginning of camp and the final morning of camp. Table 5 below provides the character strength definition.

<table>
<thead>
<tr>
<th>CHARACTER STRENGTH</th>
<th>DEFINITION</th>
</tr>
</thead>
<tbody>
<tr>
<td>ZEST</td>
<td>An approach to life filled with anticipation, excitement, and energy.</td>

GRAPH 1 This graph illustrates the change in scores for the Children’s Hope Scale. As seen in the graph, hope scores increased from pre-test to post-test and again at the follow-up assessment. A repeated measures ANOVA showed that the increase in children’s hope was statistically significant \([F (2, 1252) = 41.689; p < .001]\). This means that the campers’ level of hope increased after participating in Camp HOPE America.

CHILDREN’S CAMP HOPE RESILIENCY

Camp HOPE Resiliency is the combination of believing in self, believing in others, and believing in your dreams.

<table>

GRAPH 2 The graph above illustrates the change in scores for the Camp HOPE Resiliency Scale. A repeated measures ANOVA was computed to examine the differences in pre-camp, post-camp, and follow-up test mean scores. The results of the analyses showed an increase from pre-test to post-test and an again from post-test to follow-up. This increase in children’s resiliency was statistically significant \([F (2, 1218) = 17.939; p < .001]\). This means that the campers’ level of resiliency increased after participating in Camp HOPE America.
RESULTS

**I HAVE FRIENDS THAT REALLY CARE ABOUT ME.**

![Graph showing the change in mean scores for the statement “I have friends that really care about me.”](image)

**PRE-TEST** 4.70
**POST-TEST** 4.77
**FOLLOW-UP** 4.82

**GRAPH 3** The graph above demonstrates the change in mean scores for the statement “I have friends that really care about me.” A repeated measures ANOVA was computed to examine the differences in pre-, post-, and follow-up test mean scores. The ANOVA results suggest the change in mean scores for this item \( F(2,1256) = 2.322; p > .05 \) was statistically significant. This means that campers belief that they have friends that care about them increased after participating in Camp HOPE America.

**I’M A PART OF A GROUP OF PEOPLE THAT CARE ABOUT EACH OTHER.**

![Graph showing the change in mean scores for the item “I feel like I’m a part of a group of people that care about each other.”](image)

**Graph 6** This graph demonstrates the change in mean scores for the item “Others like me just the way I am.” A repeated measures ANOVA was computed to examine the differences in pre-, post-, and follow-up test mean scores. The ANOVA results suggest the change in mean scores for this item \[F (2, 1254) = 9.949; \ p < .001\] was statistically significant. This means that campers’ belief that they are part of a group of people that care about each other increased after participating in Camp HOPE America.
RESULTS

**GRAPH 7** The graph above demonstrates the change in mean scores for the item “Even when bad things happen, I still feel hopeful about the future.” A repeated measures ANOVA was computed to examine the differences in pre-, post-, and follow-up test mean scores. The ANOVA results suggest the change in mean scores for this item \( F (2, 1262) = 8.071; \ p < .001 \) was statistically significant. This means that campers’ belief that they are part of a group of people that care about each other increased after participating in Camp HOPE America.

**GRAPH 8** This graph demonstrates the change in mean scores for the question “I think I will achieve my dreams.” A repeated measures ANOVA was computed to examine the differences in pre-, post-, and follow-up test mean scores. The ANOVA results suggest the change in mean scores for this item \( F (2, 1264) = 8.809; \ p < .001 \) was statistically significant. This means that campers’ belief that they will achieve their dreams increased after participating in Camp HOPE America.

COUNSELOR’S OBSERVATION OF CAMPER HOPE
Belief in yourself, belief in others, and belief in your dreams.

**GRAPH 9** This graph demonstrates the change in observed hope by the camp counselors. A paired samples t-test was computed to examine the differences in pre- and post-test mean scores. **Total hope scores** [F (1,775) = 145.588; p < .001] significantly increased; this means that individual’s levels of observable hope increased after participating in Camp HOPE America.

COUNSELOR’S OBSERVATION OF CAMPER ZEST
Zest is an approach to life filled with excitement and energy.

</tbody>
</table>

GRAPH 14 This graph demonstrates the change in observed gratitude by the camp counselors. A paired samples t-test was computed to examine the differences in pre- and post-test mean scores. Total gratitude scores \[t (848)= -14.043, p<.001\] significantly increased; this means that the individual’s levels of observable gratitude increased after participating in Camp HOPE America.
The graph above demonstrates the change in observed social intelligence by the camp counselors. A paired samples t-test was computed to examine the differences in pre- and post-test mean scores. Total scores [t (829)= -12.930, p<.001] significantly increased; this means that the individual's levels of observable social intelligence increased after participating in Camp HOPE America.

Curiosity is the search for information for its own sake. Exploring a wide range of information when solving problems.

This graph demonstrates the change in observed curiosity by the camp counselors. A paired samples t-test was computed to examine the differences in pre- and post-test mean scores. Total curiosity scores [t (846)= -16.025, p<.001] significantly increased; this means that the individual's levels of observable curiosity increased after participating in Camp HOPE America.
Camp HOPE America offers two types of camps: Classic and High Adventure. Classic camps are geared to younger children age 7 to 11 and High Adventure camps are for adolescents age 11 to 17.

High Adventure camps include more rigorous activities such as white water rafting and zip lining. The graph below illustrates the mean hope scores for Classic and High Adventure camps.

Two repeated measures ANOVA analyses were computed to examine mean hope scores for Classic and High Adventure Camps. Findings were statistically significant for both the Classic camp \( F(2, 734) = 27.633; \ p < .001 \) and High Adventure camp \( F(2, 516) = 16.501; \ p < .001 \) indicating change was observed in pre, post and follow-up mean hope scores. This indicates that scores increased in a statistically significant way after students participated in Camp HOPE America for both camp types.
METHODS

RELATIONSHIPS AMONG THE MEASURES

Table 6 provides the correlation matrix for camper and counselor measures. A correlation represents the level of relationship between two variables. The interpretation is based upon the strength of the relationship as well as the direction. Strength of a correlation is based upon Cohen's (1990) effect size heuristic. More specifically, a correlation (+ or -) of .10 or higher is considered small; a correlation (+ or -) of .30 is considered moderate, and a correlation (+ or -) of .50 is considered strong. With regards to direction, a positive correlation indicates that higher scores on one variable are associated with higher scores on the other variable. A negative correlation indicates that higher scores on one variable are associated with lower scores on the other variable. Using a correlation matrix is a parsimonious way to present several correlations among multiple variables. Identifying a specific correlation is based upon matching a row to a particular column.

EXAMPLES FROM TABLE 6

The first column on the left identifies the order of the correlations. The first item “Hope” is also the next column labeled 1. The first correlation (r = .74*) under the Hope column represents the relationship between hope and resiliency (variable 2). We interpret this correlation as follows: “Participating children who scored higher on hope had higher scores of resiliency reflecting a strong positive correlation.” Notice the correlation (r = .74*) has an asterisk indicating the finding was statistically significant (p < .05).

As another example, higher scores on child’s Resiliency (column 2) were associated with higher scores on the counselor’s observation of the child’s Optimism (row labeled 7; r = .11) and the strength was small. One more example will look at the correlation between Social Intelligence and Gratitude. Here we look at column 8 (Gratitude) and row 9 (Social Intelligence) and find the correlation is a positive value (.77*). Thus, higher scores on Gratitude are associated with higher scores on Social Intelligence, and the strength is strong.

Note: All scores obtained at post-test. N = 895. *p < .05

Correlational analysis demonstrated that an increase in children’s hope was associated with increases in the observed character strengths. More specifically, higher scores in hope were associated with higher levels of energy (Zest), perseverance toward goals (Grit), ability to regulate thoughts, feelings, and behaviors (Self-Control), an expectation that the future holds positive possibilities (Optimism), appreciation toward others (Gratitude), desire to seek out new things (Curiosity), and awareness of the feelings and motivations of others (Social Intelligence).
This report was developed to present findings from the evaluation of Camp HOPE America 2022. The primary outcome was to change the way children exposed to domestic violence believe in themselves, believe in others, believe in their dreams, and find hope for the future. The results of this study provide compelling evidence that Camp HOPE America improves the hope of children in a manner that was self-reported by the children and teens and observed by the camp counselors. Moreover, increases in Hope were associated with the character strengths of Zest, Grit, Self-Control, Optimism, Gratitude, Social Intelligence, and Curiosity.

Hope is a positive psychological strength that fosters beneficial adaptive behaviors, healthy development, and psychological and social well-being (Snyder, 1995). More specifically, Bronk, Hill, Lapsley, Talib and Finch (2009) found that high levels of hope were related to life satisfaction across the lifespan. Higher hope is associated with better coping, health and health related practices (Chang & DeSimone, 2001; Feldman & Sills, 2013; Kelsey et al., 2011). While hope has been shown to predict various indicators of well-being, it has also been shown to be malleable in intervention studies in the areas of mental health, coping with physical illness, and intimate partner violence (Berendes, Keefe, Somers, Kothadia, Porter, & Cheavens, 2010; Smith & Randall, 2007). Psychological strengths like hope tend to serve people best in difficult times. The capacity to formulate pathways and dedicate mental energy (agency) is the foundation to successful goal attainment.

Similar to hope, the improved character strengths (e.g., Zest, Grit, Self-Control) assessed in this evaluation have been shown to help prevent or buffer against negative effects of stress and trauma (Park & Peterson, 2009; Gwinn & Hellman, 2018).

Correlational analyses showed that higher scores on hope as reported by the child are associated with higher scores on the character strengths (e.g., Zest, Grit, Gratitude) as observed by the counselor. Similarly, higher scores on the resiliency measure as reported by children are also associated with higher scores on the character strengths as observed by the counselor.

The results of this evaluation support a compelling argument for the positive power of Camp HOPE America to change the lives of children exposed to domestic violence.

REFERENCES

The mission of the University of Oklahoma is to provide the best possible educational experience for students through excellence in teaching, research, creative activity, and service to the state and society. The Hope Research Center focuses this mission by collaborating with nonprofit agencies to improve program services using sound scientific practice while simultaneously training students in the application of research methodologies.

The Hope Research Center is an interdisciplinary social science unit at the University of Oklahoma, Tulsa Schusterman Center. Collaborating with nonprofit human service organizations, faculty and graduate students lead research projects with a particular focus on sustainable well-being among vulnerable and otherwise at-risk individuals, families, and communities.

Guided by the principle that hope is the theory of change that explains the positive impact program services have on client outcomes, the Center is focused on three ideas.

1. Hope buffers adversity and stress (especially in the context of trauma)
2. Increasing hope leads to positive outcomes
3. Hope can be learned and sustained through targeted program services

Faculty members who work in the center provide a full range of applied research activities including program evaluation and outcome assessment in support of nonprofit program service delivery. Participating faculty members are nationally recognized for their area of research and are expert methodologists with the capacity to match research protocols to the needs of the nonprofit community.
